

Project for the introduction of Neonatal Resuscitation Training with Simulation Education in Mongolia – Year 3

1. To strengthen Mongolia's national neonatal resuscitation training system using affordable simulation-assisted devices.
2. We will introduce ELECOM's affordable neonatal resuscitation simulation devices and collaborate with the NCPR Committee in Japan and the Mongolian Perinatal Society. The project strengthens instructor training and the development of guidelines and training materials. Expert dispatch and in-Japan training will support the establishment of a national training management system.
3. By the end of FY2026, instructors will be trained in all 21 provinces, and over 75% of perinatal healthcare workers will complete neonatal resuscitation training. A national Training Management Committee will be established to oversee instructors and training programs, while guidelines and training materials will be updated and distributed. Simulation-based neonatal resuscitation training using the devices will be integrated into the national training program and scaled nationwide.
