

In Myanmar, there are serious problems in health care, such as medical disparities in urban and rural areas, specialists shortage, and lack of post-graduate medical education system.

Basic and advanced medical education in clinical practice will be implemented by inbound and outbound medical staffs. At the same time, the engineer's training program for establishment of telemedicine would be implemented.

This project aims to provide a healthy life to all Myanmar citizens, as well as introducing Japanese medical technology and medical devices into Myanmar widely, by the synergistic effect of using both reliable hands-on guidance and efficient and sustainable distant education.

Oct.-Dec., 2020
