

# Development of Medical Resources for 事業概要のまとめ(英語版)(別添4) Gynecology, Echography, Pathology, Radiology, Endoscopy and General Diagnostic Practice in Vietnam

- Demands and interests for high-quality medication have been increasing in Vietnam due to the spread of lifestyle-disease patients under economic growth. However, the inspection and diagnosis skill level there is still low, and the development of medical resources and the upgrade of technical skills especially for gynecology, echography, pathology, radiology, endoscopy and general diagnostic practice is highly required.
- We send IUHW doctors and experts and accept Vietnamese trainees with the objective of transferring the technical know-how on Japanese state-of-the-art medical services in partnership with Cho Ray Hospital, the University of Medicine and Pharmacy at Ho Chi Minh City, and Hung Vuong Hospital. We also holds discussion and negotiation with Vinmec International General Hospital on the establishment of a medical training center for the development of medical resources and dissemination of state-of-the-art Japanese medical equipment.
- The primary objective of this project is to upgrade the technical level in gynecology, echography, pathology, radiology, endoscopy and general diagnostic practice at the partner hospitals through the training provided by doctors and experts of IUHW and group hospitals. The dissemination of accurate diagnosis, early detection and treatment of the diseases, and health promotion is also expected in the long run.
